

Lesson 2: Console Application

Basic I/O

Console **input/output** operations are carried out by the **Console** class which is inside system namespace and is stored in Mscorlib (in Mscorlib.dll) assembly.

Data from the console is read from the standard input stream; normal data to the console is written to the standard output stream; and error data to the console is written to the standard error output stream. These streams are automatically associated with the console when your application start, and are presented to you as the In, Out, and Error properties.
